

TryThis — Full Product Strategy, MVP, Architecture & Execution Blueprint

Executive Summary

TryThis is an AI-powered intent-to-action platform.

The platform allows users to save content from across the internet (primarily Instagram initially) and transforms unstructured inspiration into actionable intelligence.

Users already discover:

- travel destinations
- cafes
- shopping products
- gadgets
- restaurants
- experiences
- hidden gems
- fashion items
- hotels
- activities

But current behavior is broken.

Current flow:

Discover → Save → Forget

TryThis changes this into:

Discover → Save → Understand → Organize → Recommend → Plan → Execute

The core product thesis:

“Users don’t need another bookmarking app. They need AI help to actually do the things they save.”

Core User Problem

Users currently use:

- Instagram Saves
- screenshots
- WhatsApp self-chat
- Notes app
- bookmarks
- Pinterest
- Google Maps

Problems:

- fragmented memory
- difficult rediscovery
- no organization
- no planning help
- no execution layer
- no contextual intelligence
- no price tracking
- no personalization

Users constantly say:

- "Let's try this someday"
- "Save this"
- "I'll visit later"
- "I'll buy this later"

But most saved content is never acted upon.

Product Vision

TryThis becomes:

"AI memory and execution layer for real-world intent."

The platform helps users:

- save things instantly
- remember them later
- rediscover contextually
- compare options
- get recommendations

- plan automatically
 - receive smart notifications
 - execute experiences
-

Product Positioning

NOT:

- travel planner
- bookmarking app
- save links tool
- Pinterest clone
- Instagram collections competitor

INSTEAD:

“Save anything from the internet. Let AI help you actually use it later.”

Core Categories Supported

Phase 1 Categories

Travel

Examples:

- Goa reels
- mountain destinations
- itineraries
- hidden places

Cafes & Restaurants

Examples:

- hidden cafes
- rooftop restaurants
- aesthetic spots
- budget food places

Experiences

Examples:

- concerts
 - date places
 - activities
 - local experiences
-

Phase 2 Categories

Shopping

Examples:

- sneakers
- gadgets
- furniture
- home decor

Fashion

Examples:

- outfits
- creator looks
- shoes
- accessories

Beauty

Examples:

- skincare
- makeup
- haircare

Tech Products

Examples:

- keyboards
- monitors
- gaming setup

- accessories
-

Core Product Flow

```
Instagram Reel
→ Share to TryThis
→ Metadata Extraction
→ AI Understanding
→ Structured Save
→ Recommendations
→ Smart Notifications
→ Planning / Purchase / Visit
→ Re-engagement
```

MVP Strategy

Goal Of MVP

NOT:

- monetization
- bookings
- full AI automation
- social network

The MVP goal is ONLY:

“Will users repeatedly save and revisit experiences?”

MVP Scope

Timeline:

- 4–6 weeks

Core features only.

MVP Features

1. Instant Save

Most important feature.

Flow:

Instagram → Share → TryThis

User should save within:

- 2–3 seconds maximum

No complicated onboarding.

2. Metadata Extraction

The app extracts:

- title
- description
- hashtags
- image
- creator
- URLs

Example:

```
{  
  "category": "Travel",  
  "hashtags": ["#goa", "#travel"],  
  "image": "thumbnail.jpg"  
}
```

3. AI Intent Extraction

The app understands:

- what the user wants
- whether it is travel/shopping/food/etc.

Examples:

```
{
  "intent": "Trip Planning",
  "category": "Travel",
  "places": ["Goa", "Gokarna"]
}
```

OR

```
{
  "intent": "Buy",
  "category": "Shopping",
  "brand": "Nike",
  "productType": "Sneakers"
}
```

4. AI Collections

Automatically organize saves into:

- travel
- cafes
- shopping
- gadgets
- fashion
- hidden gems

No manual folder management initially.

5. Search & Recall

Users can search:

cheap cafes
mountain places
white sneakers
budget trips

This creates rediscovery value.

6. Smart Resurfacing

Examples:

- "You saved this 2 months ago"
- "This place is near you"
- "Long weekend coming"

This is critical for retention.

MVP Features To Avoid

DO NOT BUILD:

- social feed
- likes/comments
- chat
- booking engine
- payments
- creator marketplace
- complicated AI planner
- flight inventory
- train inventory

These massively increase complexity.

Technical Architecture

Mobile App

Recommended:

- React Native

Reason:

- faster iteration
 - single codebase
 - lower cost
-

Backend

Recommended:

- Node.js or Kotlin
-

Database

Recommended:

- MongoDB

Reason:

- flexible schema
 - evolving AI structure
 - dynamic metadata
 - rapid iteration
-

Core Backend Services

1. Ingestion Service

Handles:

- Instagram links
- screenshots
- future YouTube/Pinterest links

Responsibilities:

- receive shared content
 - queue processing
 - store raw metadata
-

2. Extraction Engine

Handles:

- metadata extraction
 - hashtags
 - OCR
 - entity detection
 - category classification
-

3. NLP & AI Service

Responsible for:

- intent understanding
 - embeddings
 - semantic tagging
 - recommendation understanding
-

4. Recommendation Engine

Provides:

- similar places
 - related products
 - nearby experiences
 - contextual suggestions
-

5. Notification Engine

Triggers:

- price drops
 - nearby suggestions
 - long weekend alerts
 - weather-based suggestions
 - re-engagement reminders
-

6. Planning Engine (Future)

Responsible for:

- itineraries
 - shopping comparisons
 - budget planning
 - execution assistance
-

Data Pipeline

```
User Shares Reel
→ Queue
→ Metadata Fetch
→ OCR
→ NLP Extraction
→ Entity Detection
→ Embedding Generation
```

- Structured Save
- Recommendation Index

Content Extraction System

Initial Extraction Sources

Open Graph Metadata

Extract:

- title
- description
- thumbnail

Caption Parsing

Creators often provide:

-  Location
-  Timing
-  Price
-  Recommendation

This is extremely useful for MVP extraction.

OCR Extraction

Future enhancement.

Extract text from:

- thumbnails
- screenshots
- video frames

Useful because many reels contain:

- prices
 - cafe names
 - locations
 - product names
-

NLP Entity Extraction

Extract:

- locations
 - product names
 - brands
 - activities
 - categories
 - intents
-

Embeddings & Semantic Search

Future intelligence layer.

Allows:

- "mountain trips"
- "cheap cafes"
- "white sneakers"
- "date places"

without keyword dependence.

Example Structured Objects

Travel Save

```
{  
  "category": "Travel",  
  "intent": "Trip Planning",  
  "places": ["Goa", "Gokarna"],
```

```
"vibe": "Beach Vacation",  
"budget": "Mid-range"  
}
```

Cafe Save

```
{  
  "category": "Food",  
  "intent": "Visit",  
  "place": "Blue Tokai",  
  "city": "Gurgaon",  
  "vibe": "Work Cafe"  
}
```

Shopping Save

```
{  
  "category": "Shopping",  
  "intent": "Buy",  
  "brand": "Nike",  
  "productType": "Sneakers",  
  "estimatedPrice": 5000  
}
```

Recommendation System

Travel Recommendations

Examples:

- similar destinations
 - nearby hidden places
 - budget itineraries
 - best season to visit
-

Shopping Recommendations

Examples:

- Amazon links
 - Flipkart links
 - alternative products
 - cheaper sellers
 - similar styles
-

Food Recommendations

Examples:

- nearby cafes
 - trending spots
 - similar vibe places
 - date cafes
-

Notification System

Travel Notifications

Examples:

- "Flights to Goa dropped 18%"
 - "Long weekend coming"
 - "Best weather for your saved trip"
-

Shopping Notifications

Examples:

- "Price dropped on your saved sneakers"
 - "Back in stock"
 - "Better alternative available"
-

Food Notifications

Examples:

- "Cafe you saved is nearby"
 - "Trending places near CyberHub"
-

Smart Contextual Notifications

Examples:

- weather-aware
- location-aware
- timing-aware
- budget-aware

These become major retention drivers.

AI Intelligence Roadmap

Phase 1

Simple:

- regex
 - keyword matching
 - hardcoded categories
 - metadata extraction
-

Phase 2

Intermediate:

- embeddings
 - semantic search
 - OCR
 - vector database
-

Phase 3

Advanced:

- personalized recommendation graph
 - predictive notifications
 - behavioral learning
 - itinerary generation
 - intelligent shopping suggestions
-

Monetization Strategy

Phase 1

No monetization focus.

Focus:

- retention
 - engagement
 - save frequency
-

Phase 2

Affiliate Monetization.

Shopping

Affiliate links:

- Amazon
 - Flipkart
 - Myntra
 - Ajio
-

Travel

Affiliate links:

- flights
- hotels
- stays
- experiences

Possible integrations:

- Skyscanner
 - Amadeus
 - Booking.com
-

Phase 3

Premium AI Features

Examples:

- advanced planning
 - smart trip generation
 - personalized deal intelligence
 - AI shopping assistant
-

User Retention Strategy

Biggest Retention Drivers

Feature	Importance
frictionless saving	critical
rediscovery	critical
personalized recommendations	huge
smart notifications	massive
contextual intelligence	huge
execution help	huge

Biggest Product Risks

1. Weak Retention

Users save but never return.

Solution:

- resurfacing
- smart notifications
- useful recommendations

2. Generic Suggestions

Kills trust instantly.

Solution:

- embeddings
- personalization
- behavioral learning

3. Overbuilding Early

Massive founder trap.

Solution:

- validate save behavior first
- add intelligence gradually

4. Supporting Too Many Categories Too Early

Creates chaos.

Solution:

- start with travel + cafes + experiences
 - expand later into shopping/fashion/gadgets
-

Product Expansion Roadmap

Phase 1

Travel + Cafes + Experiences

Goal:

- validate saves
 - validate recall
 - validate recommendations
-

Phase 2

Shopping + Fashion + Gadgets

Goal:

- increase daily usage
 - increase monetization
 - improve retention frequency
-

Phase 3

AI Planning Layer

Goal:

- execution support
 - smart itineraries
 - personalized shopping guidance
-

Phase 4

Universal Intent Engine

Goal:

- understand all saved behaviors
 - proactively assist users
 - become AI execution layer for real-world experiences
-

Final Product Philosophy

The real moat is NOT:

- scraping
- bookmarking
- metadata extraction

The moat becomes:

- behavioral intelligence
 - intent understanding
 - contextual recommendations
 - memory graph
 - execution assistance
 - personalized experience planning
-

Final Positioning

“Save anything from the internet. Let AI help you actually use it later.”
