

WannaTry

SUMMARY

Version: 1.0. Product: WannaTry. Primary Verticals: Travel + Food. Core Technology: AI Experience Understanding + Personal Memory Engine + Voice. Initial Market: India. Long-Term Market: Global.

PRODUCT VISION

The Problem: People discover experiences everywhere (Instagram, YouTube, TikTok, Google, WhatsApp, friends, blogs, maps, food pages, travel creators) but discovery is fragmented. There is no single system that remembers what the user discovered, wanted to try, actually tried, liked/disliked, why, with whom, and what they are likely to enjoy next. WannaTry Promise: "WannaTry helps you discover, save, plan and actually try great places, trips and food."

Brand idea: "The Internet is where you discover things. WannaTry is where you remember the things you want to try."

Long-term vision: Build an AI-powered Personal Experience Memory Engine that understands a user's taste in experiences and continuously improves recommendations.

PRODUCT PRINCIPLE

Discover → Save → Plan → Try → Rate → Learn → Recommend. The user should never feel like they are "training an AI." Instead: "The user uses WannaTry normally. WannaTry learns naturally."

PRODUCT ARCHITECTURE

Five layers: 1) Discovery (Trips, Treks, Destinations, Hotels, Stays, Activities, Restaurants, Cafes, Dishes, Food experiences, Recipes). 2) Capture (WannaTry feed, Instagram, YouTube, TikTok, WhatsApp, Browser, Screenshot, Camera, Manual entry, Voice). 3) Experience Understanding (AI converts messy content into structured Experience with category, location, attributes, price, source, confidence). 4) Memory Engine (User → Experiences → Interactions → Preferences → Patterns → Context → Predictions). 5) Recommendation & Action (answers what to try, where to eat/go, what not tried, what likely to like, etc.).

MEMORY ENGINE

Episodic Memory stores what happened (example includes Kheerganga Trek with date, people, rating, liked/disliked). Preference Memory converts experiences into probabilistic preferences. Pattern Memory finds repeated behavior (e.g., prefers scenic outdoor and avoids crowded tourist destinations). Prediction Memory predicts what user may want next based on context and memory.

EXPERIENCE OBJECT

Everything should become an Experience Object (example JSON with type, name, location, attributes, price_range, source, confidence). A single Experience Object can have many users. Do not create duplicates per user; create canonical entities and attach user-specific memory.

ONBOARDING AND PERSONALIZATION

Objective: Gather enough initial info for useful first feed without exhaustion. Includes promise screen, initial interests (Travel/Food), taste calibration via choices, optional profile signals, import existing saves, onboarding-to-feed loop, and continuous learning from feed signals (impression to rating). Save means interest to remember, not necessarily love.

FEED AND RECOMMENDATION

Feed should work for new users (trending/popular/interests), partially learned users, and mature users with highly personalized sections. Recommendation score combines preference match, context, location, time/season, budget, novelty, social context, popularity, quality, minus already tried and explicit dislikes. Goal: probability user will actually enjoy an experience.

SAVE, CAPTURE, AND EXTRACTION

Save is core action (WannaTry / Save to WannaTry). Optional save-reason chips add contextual memory. Core capability: save anything from anywhere. AI extraction pipeline emphasizes cheapest available signals first; use LLM only when needed. Immediate UX: instant save confirmation, then async understanding. Confidence thresholds define auto-confirm vs. user confirmation. Strong deduplication strategy for scale.

VOICE AND REMINDERS

Voice is an interface to the Memory Engine: Discover, Remember, Reflect, Recommend, Plan, plus Voice + Save notes. Remind Me tied to saved experiences with future context-aware smart reminders that trigger action.

MAPS, EXPERIENCE PAGE, AND LIFECYCLE

Use maps where location adds value (nearby, planning, saved places, itinerary visualization), not as full maps replacement. Experience page includes hero, details, why user may like it, attributes, pricing, source, save/plan/remind/map/share. Experience status lifecycle: Discovered → Saved → Considering → Planned → Booked → Visited → Rated → Remembered.

PLANNING, FOOD, RECIPES, AND SEARCH

Trip planning phased over time; group trips later with overlap resolution. Food treated as experiences (restaurant/cafe/dish/recipe/street food). Recipes can be ingested from multiple sources and moved through Save → Cook → Rate → Remember. Search supports traditional and natural language; voice uses same engine.

PRIVACY AND PRINCIPLES

Personal memory is sensitive: explain remembered data, allow edit/delete/disable personalization, never sell personal taste profiles, avoid exposing private memory to advertisers.

PHASED ROADMAP

Phase 0 Foundation; Phase 1 MVP; Phase 2 AI Capture; Phase 3 Memory Engine V1; Phase 4 Voice + Memory; Phase 5 Action Layer; Phase 6 Smart Reminders; Phase 7 Advanced Trip Planning; Phase 8 Group Memory; Phase 9 Experience Graph.

REVENUE STRATEGY

Base product should be free. Revenue streams: transaction commission, affiliate, business promotion, premium (later), creator economy. Monetization rule: optimize for useful experiences actually tried, not ad impressions. North-star commercial metric: Discovery → Action Conversion.

METRICS AND NORTH STAR

Metrics across acquisition, activation, engagement, personalization, memory, action, and business. Long-term north star: meaningful experiences successfully discovered and acted upon per active user. Simpler operational metric: Save → Try Conversion.

TECHNICAL AND DATA SYSTEMS

Prefer deterministic systems where possible; escalate to AI only as needed. Event model for all meaningful interactions feeding memory and recommendations. Recommendation architecture evolves from rules/popularity/location to collaborative filtering and eventually memory graph + context + embeddings + behavior + constraints + novelty + availability.

PRODUCT STRATEGY AND POSITIONING

Global expansion in phases from India to selected international markets then broader markets after retention and economics proof. Competitive positioning: not better maps/reels/reviews/chatbot; core is remembering what users want to experience and learning what they'll love next. Defensibility in experience graph + personal memory + behavior + taste + outcomes + feedback.

DESIGN BRIEF AND MVP

UI should follow PRD without inventing functionality; maintain teal-green WannaTry visual language; mobile-first, fast, visual, AI naturally integrated. MVP includes signup, onboarding, interests, feed, search, save, saved experiences, rating, profile, extraction, basic recommendation/memory, natural language search, voice search/recommendation, maps, reminders, URL/screenshot capture. MVP success: users repeatedly discover, save, return, search, use recommendations, try, give feedback, and recommendations improve over time.

FINAL STRATEGIC POSITION

WannaTry starts as a Travel + Food discovery app, then becomes a place to save everything to try, then an AI understanding preferences, then personal experience memory, and eventually a personal experience intelligence layer helping decide what to experience next and make it happen.
